Kick-off meeting

NEWSLETTER 2

"This European project is very interesting. In recent years we have begun to feel that temperatures have changed. The causes of these temperature rises are various. For example, environmental pollution. We all know that pollution is the contamination of the environment with materials that interfere with human health, quality of life or the natural function of ecosystems. If we pollute, climate change will slowly but surely occur. Climate change appears in the statistical distribution of meteorological patterns when this change lasts over an extended period of time (decades to millions of years). This project is welcome for us, the students but also for our teachers. It must teach us to work together so that we can fight these problems together."- student *Popescu Sara*, 7th grade A

NEWSLETTER 2

Climate change is a very important issue because it represents massive changes that need to be stopped. To truly succeed, all people need to contribute in one way or another. People need to understand that climate change - especially global warming - is something that changes their lives, something that could destroy the world, sooner or later. This European project is based on climate change. The project activities aim to involve students and teachers from other countries in trying to make people understand the gravity of climate change and bring small changes locally. Together we

can save the planet and make it a better place!" - student *Mateescu Raisa, 7th grade C*

"Strong beliefs about the need to protect the environment are formed when starting from concrete positive and negative examples encountered in life by students.

The city of Craiova is located in a region called "Romanian Desert", which has a large area of land subject to desertification, because in recent years temperatures have recorded records of over 40 degrees Celsius and there have been long periods of drought. Consequently, we are witnessing the concrete effects of global warming.

I consider that the theme of this project is current, because its implementation aims to develop the skills needed to identify and investigate environmental issues, as well as attracting girls to study science. Also, the collaboration with European partners with extensive experience in this field, is an opportunity to benefit from scientific information and practical activities aimed at finalizing the project.

The really important achievement is to offer students the opportunity to learn how to initiate and organize actions with scientific themes, related to environmental protection. Only then, the success of ecological education is complete, and we no longer have to worry about the future." - Prof. Popescu Ileana

"Participation in this European project is a good opportunity to implement the notion of European citizenship, to actively involve teachers and students in the project activities, which will have a strong educational character, leading to increased transparency and attracting attention in supporting all the factors involved, directly or indirectly. " - Prof. Nuță Elena-Deputy Director of the "Gheorghe Țițeica" Elementary School, Craiova
